

Data Protection

8 New Rights & Freedoms

An infographic brought to you by  **Datavault**

The General Data Protection Regulations (GDPR) will be in force from May 2017. The individual's new rights are highlighted below with a comment about how good Data Governance and a Datavault Data Warehouse will assist.

1

Right to be informed

You must clearly and simply specify how you will use personal data.

Good data governance will mean that carefully considered privacy notices are provided to explain who is processing, why, for how long, where the data is from, etc.

2

Right of access

You must respond to a "subject access request" for free within 30 days confirming what data you hold.

A Data Warehouse for personal data will show where data is held and will be an enabler for viewing and exposing information automatically, quickly and accurately.

3

Right to rectification

You must rectify inaccurate or incomplete information within a month (or 2 months if complex). Including data passed to 3rd parties (+ tell the subject about the 3rd parties involved).

The Datavault approach to data loading means that data is loaded 'as is' so you know what you knew and when as a timed event. The source of inaccuracies can be readily identified and changes facilitated. Understanding where data has come from and gone to is a core principle.

4

Right to erasure "to be forgotten"

There is a right to request deletion of personal data where there is no compelling reason to continue to hold it (there are some). Where this data has been passed to 3rd parties the request must be passed on.

To delete data, you first need to know where it resides. Having a central record facilitates the processes for automated, efficient deletion of records wherever they reside. View data and then view that it has gone.

5

Right to restrict processing

This where a data subject doesn't want data erased or you are considering whether or not data should be erased.

Data may be processed in multiple applications a single point of load allows for a filter before data is passed to multiple applications. The Data Warehouse will allow tagging of data that is still legitimately processed and preventing processing elsewhere.

6

Right to data portability

This allows a customer to request you take a copy of their data and pass it on, in a common format, to another organisation.

A Datavault warehouse will facilitate knowing what data you have and standardise the export formats (APIs) for different organisations and reporting when rights have been exercised.

7

Right to object

This gives the right to object to processing on grounds relating to their particular situation.

Data governance procedures should be automated. A Datavault Warehouse has filters to restrict processing, avoiding expensive time consuming manual processes but allowing for ad hoc human intervention.

8

Automated decisions & profiling Rights

Profiling involves algorithms to evaluate or predict behaviour or preferences. These rights are designed to safeguard individuals against damage from decisions taken without human intervention and allow to get an explanation and challenge it.

To delete data, you first need to know where it resides. Having a central record facilitates the processes for automated, efficient deletion of records wherever they reside. View data and then view that it has gone.
